Background	The B lymphocyte antigen receptor is a multimeric complex that includes the antigen-specific component, surface immunoglobulin (Ig). Surface Ig non-covalently associates with two other proteins, Ig-alpha and Ig-beta, which are necessary for expression and function of the B-cell antigen receptor. This gene encodes the Ig-beta protein of the B-cell antigen component. Alternatively spliced transcript variants encoding different isoforms have been described. [provided by RefSeq, Jul 2008]

Figure 1. Flow cytometry analysis with Anti-CD79B (52A11) mAb on Expi293 cells transfected with human CD79B (Blue histogram) or Expi293 transfected with irrelevant protein (Red histogram).

Figure 2. Flow cytometry analysis of antigen binding of anti-human CD79B mAb(DMC101033).

(A) DMC101033 does not bind to 293T cells that do not express CD79B.

(B) A clear peak shift of DMC101033 was seen compared to the control when incubated with CD79B-expressing Raji cells, indicating strong binding of DMC101033 to CD79B. Antibodies were incubated at 5 µg/mL.
