This gene is a member of the leukocyte

immunoglobulin-like receptor (LIR) family; which is found in a gene cluster at chromosomal region 19q13.4. The encoded protein belongs to the subfamily B class of LIR receptors which contain two or four extracellular immunoglobulin domains; a transmembrane domain; and two to

four cytoplasmic immunoreceptor tyrosine-based inhibitory motifs (ITIMs). The receptor is

Background expressed on immune cells where it binds to MHC

class I molecules on antigen-presenting cells and transduces a negative signal that inhibits

stimulation of an immune response. It is thought to control inflammatory responses and

cytotoxicity to help focus the immune response and limit autoreactivity. Multiple transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq; Jul
