Olfactory receptors interact with odorant molecules in the nose, to initiate a neuronal response that triggers the perception of a smell. The olfactory receptor proteins are members of a large family of G-protein-coupled receptors (GPCR) arising from single coding-exon genes. Olfactory receptors share a 7-transmembrane domain structure with many neurotransmitter and

hormone receptors and are responsible for the recognition and G protein-mediated transduction of odorant signals. The olfactory receptor gene family is the largest in the genome. The nomenclature assigned to the olfactory receptor

genes and proteins for this organism is independent of other organisms.

**Usage** Research use only Conjugate Unconjugated

**Background** 

## **ELISA assay to evaluate OR2H1-MNP** 0.5µg Human OR2H1-MNP per well

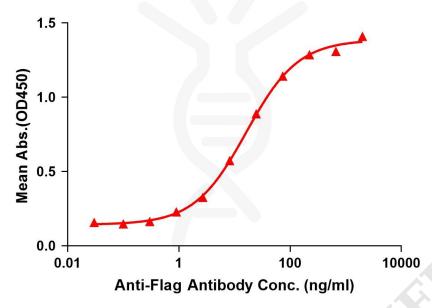

Figure 1. Elisa plates were pre-coated with 0.5μg/per well purified human OR2H1 full length membrane nanoparticles. Serial diluted anti-Flag monoclonal antibody solutions were added, washed, and incubated with secondary antibody before Elisa reading. From above data, the EC50 for anti-Flag monoclonal antibody binding with OR2H1 full length membrane nanoparticles is 16.33ng/ml.
